

UC Davis survey on Nitrogen Management

This June 2018 the University of California Davis is sending a survey to nearly 4,000 growers across the Central Valley to investigate nitrogen (N) management approaches in different irrigated agricultural systems. The survey seeks to understand growers' experiences with and opinions on N management policy and outreach programs. The survey offers the opportunity for grower to voice their needs and concerns around the progressing N management policies and give feedback that will influence future research and extension activities focused on how to most efficiently improve N management. The development and implementation of the survey has been supported by multiple agricultural organizations including the University of California Cooperative Extension, NRCS Resource Conservation Districts, California Department of Food and Agriculture, and several industry associations.

We encourage your participation in the survey!
